# **WEATHER SYNOPSIS BY REGION**

## **NORTHERN CALIFORNIA**

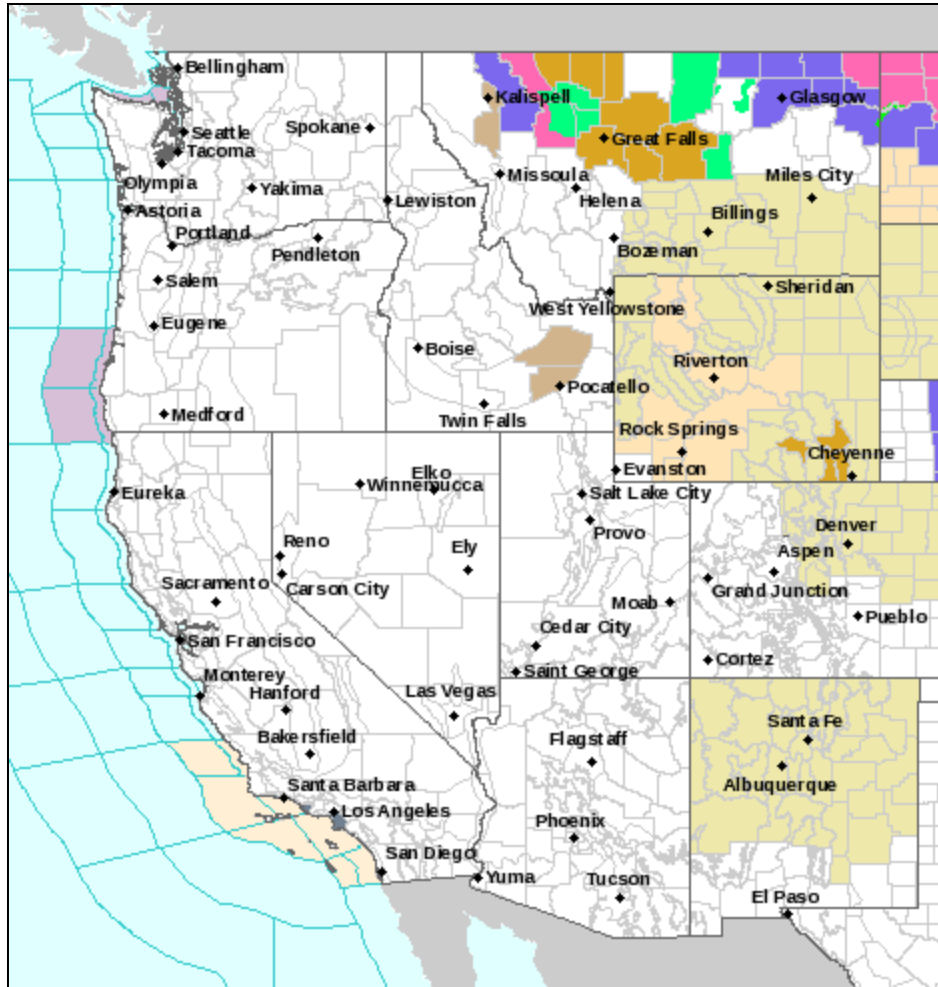

High pressure off the CA coast will be our dominant weather feature through today. Afternoon temperatures will be 15-20 degrees above normal through today. Afternoon minimum relative humidity (RH) readings will be 15-25% in inland areas affected by the winds, and 20-30% otherwise. A weak low pressure trough will move across the region this weekend. Temperatures will be a few degrees cooler, but still above normal, and humidity will be higher. There will be a few clouds, but no rain is expected. A slightly stronger trough will move through Tuesday night and Wednesday with a few light showers possible, mainly in the north and east. A third system is expected late next week and into the weekend. This one is expected to produce more widespread rain with snow levels lowering during the weekend.

In general, the period through mid April will likely be characterized by stretches of warm, dry, and breezy weather lasting 1-4 days, interrupted by weak weather systems that will produce mostly light rain and high elevation snow, leading to overall drier and warmer than normal conditions.

## **SOUTHERN CALIFORNIA**

Temperatures will warm a couple of degrees each day through today as a ridge of high pressure builds into California from the Pacific Ocean. Maximum temperatures will be in the mid 60s to mid 70s across the mountains and mid 70s to mid 80s in the valleys through today. A gradual cooling trend will occur Saturday through the middle of next week as the ridge of high pressure weakens and zonal flow takes place. Minimum humidity will be mainly between 15% and 30% away from the coastal areas through the middle of next week. There will be local gusty afternoon winds over the mountain ridges and desert passes Saturday through the middle of next week, otherwise winds will be light through the middle of next week.
